

the new revolutionary p2p media provider

November 26, 2013

Abstract

WeTube comes in a time in which we are seeing enormous efforts from the people to overcome the problems of censorship and central information control over all Internet. Notorious are the examples of YouTube, Vimeo, and other regulated places. YouTube itself, for example, is directly censored in many countries (https://en.wikipedia.org/wiki/YouTube_Censorship), impeding people to access to the biggest media database available today for humans, and therefore making a precious source of information not available for human evolution and free interchange of information.

But not only censorships occur to websites, but also the websites themselves are obliged to censor many of the contents that the users upload, many times to adjust to arbitrary regulations that are imposed by a few, only serve a few, and restrict the majority.

We believe this is a serious problem, and we should overcome it by the means we can for the moment: technology.

We are happy to present here a good solution, and we expect that the technology expressed in this document can make you excited enough to understand the big implications that this is going to achieve very soon.

We exhort you to join us. We truly need you, as this is a movement from humans to humans. Please read on.

The three pillars of WeTube: freedom, privacy, voluntary moderation

Imagine a web page where you can upload any video, music, image or document, and it will be immediately available to everybody without restrictions, without anybody knowing who you are (if you want), without anybody censoring you.

Imagine a web page where you can access any media you want without anybody having to know what are you doing, not being imposed to authenticate with your real ID, IP, or associated credit card number, not being observed by the big brother, and at the same time the content you access is of high quality and helpful for your evolution and relationships.

Imagine you are a publisher, a periodist or an editor, and there is a place where you can safely publish your discoveries, but without any censorship at all, while at the same time you are able to get rid of the junk and noise around you, providing only good quality researches and associations with your audience.

Imagine you are an artist that lives for and from your art, and you have a free place where you can express your ideas and concepts, participate in community with your followers and other artists, and even earn the money you deserve for your hard work, without imposing others and not having to pay big commissions to any private editor or distributor, nor having to support their greed and censorship.

Imagine a media where you can get rid of the junk so easy as doing a click. Imagine being your own moderator, where you can select what is good and bad for yourself and your family, without having to surrender yourself to what other has decided, specially when that other is trying to impose you a vision you don't agree with.

Imagine a place where you can choose multiple moderators, including yourself or no moderators at all, being them people and organizations you really trust, and the possibility to add or remove them without restriction. Imagine how good a free moderator could be if their motivation is to serve only what people want while removing what they don't, not what a big guy on top of him/her decides. Moderators with big impositions and bad appliance of filters would be rapidly abandoned by the community, and their reputation diminished.

Imagine that the media you see is temporaly stored on your computer so you can see it multiple times without having to reload it. Imagine that the content you like most is permanently stored on your computer so if you lost your internet connection you can still access it. Imagine a safeguard of all the important media you have in case of media server shutdowns, human crisis, war, or government censorship. You don't have that in

today's standard media providers, as they prohibit you to store the content. Even companies like Google prohibits the publishing of browsers add-ons that use a trick to record the media, making YouTube videos very difficult to get stored locally with the Chrome browser.

Imagine that you are a legit entrepreneur and have a useful and good business that you need to promote. The audience of this new media provider will be large and a real opportunity for you to come in. Every single area of business you can think of is covered, and you'll be able to perfectly select the categories you want to be in. Even better is the fact that advertisers can select to what moderation they want to be attached, so you can perfectly choose moderators who provide legal only content in your country.

Imagine that you are a programmer and/or a system administrator and you want your deserved reward for your hard work while being useful to humanity. You can host a server and earn bitcoins proportional to the amount of bandwidth, space and maintenance you serve. At the same time, the protocol is specially designed to protect you against the arbitrary laws, as you can select which moderators you're going to serve, and therefore, the content your server helps the user to download. But not even that, most of the contents are actually not stored in your servers, but interchanged between users alone, making this protocol a really distributed anonymous one. We even optionally protect your IP with a technology similar to hidden Tor services if you want to serve delicate searches, at only the cost of some added latency. You are a crucial part of this revolution.
